

Example;

JSON:

```
{
  "Google": {
    "employees": [
      {"employeeId":1000,"name":"John Doe","jobTitle":"Software Engineer","department":"Engineering","salary":100000},
      {"employeeId":1001,"name":"Jane Doe","jobTitle":"Cloud Engineer","department":"Engineering","salary":90000},
      {"employeeId":1002,"name":"Johnny Doe","jobTitle":"Database Engineer","department":"Engineering","salary":75000},
      {"employeeId": 3}
    ]
  }
}
```

Path Query:

Test cases:

- Google.employees[*].name => ["John Doe", "Jane Doe", "Johnny Doe", null]. // If the key is not present in a "[*]", return null.

Google.employees[*].employeeId = [1000, 1001, 1002, null]. If key is not present in a "[*]", return null.

Google.employees[*].jobTitle = ["Software Engineer", "Cloud Engineer", "Database Engineer", null] . //if jobTitle DNE in [*] E, then return null.

Google.employees[*].salary = [100000, 90000, 75000, null] . if salary DNE in [*], return null.

Google.employees[*].department = ["Engineering", null] . if salary DNE in [*], return null.

- Google.employees[*].email = [null, null, null, null]
- GET name FROM Google.employees WHERE employeeId = 1001 = ["Jane Doe"]

- GET employeeId FROM Google.employees WHERE salary < 80000 = [1002]
- GET name FROM Google.employees WHERE department = "Engineering" AND salary > 80000 ["John Doe", "Jane Doe"]
